

Presentation Neste Oil at RSPO RT12 18 November 2014

NESTE OIL

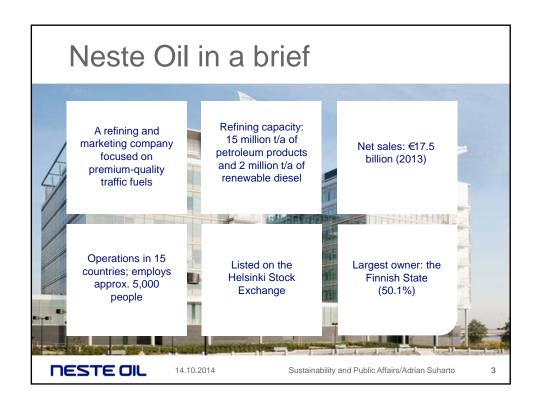

Table of Contents

- 1 Introduction to Neste Oil
- 2. The Biofuels Industry
- 3. The EU RED and Upgrading to RSPO-RED
- 4. Neste Oil Position on Going Beyond
- 5. Summary

Sustainability and Public Affairs/Adrian Suharto

Sustainability is regulated for Biofuels

- Compared to other industries, Biofuels industry is highly regulated
- Regulation for biofuels are designed as a clear alternative to traditional fuels, based on country-based mandate, aimed to:

Manage Impacts of Climate Change Improve Security of Supply

Support Agriculture

· Regulations thus are made to:

Demonstrate GHG savings compared to fossil fuels Assure the sustainability of the supply chain Set clear target and mandates (not subsidies) for biofuels

- Neste Oil has observed the increasing tendency of industrialized countries to establish regulations for the sustainability of biofuels.
- Different countries/ markets have different definition for sustainability, however it essentially covers the same requirements for the supply chain.

NESTE OIL

The European Union Renewable Energy Directive (EU-RED)

- Directive 2009/28/EC (RED) promotes the use of renewable energy and defines the framework for sustainability certification
 - Article 17, 18, 19 and the annex laid out the requirements for biofuel use in the EU
 - 10% of energy used in transport to be from renewable sources
 - Biofuel for transport must achieve 35% Greenhouse Gas (GHG) savings compared to fossil fuels (2017 – 50%, 2018 – 60%). The Fuel Quality Directive will aim for higher savings.
 - However waste and residue definitions are left to individual member states

Opportunity in upgrading to RSPO-RED

- Why RSPO-RED?
 - Demand for GHG data is expected to widen to other palm oil users in the future. Feedstock plays a big impact in GHG emissions.
 - RSPO-RED contains GHG calculation requirements (based on EU-RED methodology). Company complying with this requirement would be ahead of the competition
 - It's a certification for a regulated fixed market. Biofuel sustainability certification is compulsory in the EU. Demand will be regulated by law.
 - Large volume needs. 10% of 220 million tonnes of diesel currently being used in the EU need to be renewable. Palm Oil the most competitive oil to fill this gap
 - RSPO-RED certification is only a simple upgrade to existing RSPO certification. RSPO-RED audit can be included in the scope of the next surveillance audit.

Neste Oil Certification Experience

- In 2013, Neste Oil refineries, storages and relevant supply chains are certified with ISCC, RSPO-RED and DDC
 - We have experience in previous years assisting our suppliers for gap assessment against ISCC standards
- Most Neste Oil palm oil suppliers are certified with ISCC, and RSPO and some are segregated
 - · Certification audits are done by the suppliers
 - Certification includes smallholders and their supply chain
 - We increased smallholder certified palm oil volume from 9,000 families to 54,000 families
 - More suppliers are certified compared to the first time we started buying (starting from zero)
- However despite all the certification we have, negative campaigns and concerns on the use of Palm Oil still is gaining strength

Neste Oil Position - Preferred supply

Increasing waste and residues

- Supply from palm residues such as PFAD
- Using Neste Oil HVO Verification Scheme

supply chain management Traceability beyond mass

Improving traceability and

- Traceability beyond mass balance (third party suppliers)
- Company procurement policies must apply to third party suppliers

Going beyond Certification Requirements

- No-peat, No-HCS policy against deforestation
- Social issues, labour rights, Fair treatment of workers according to ILO

Further GHG savings improvements

- Installation of methane capture to mills
- Implementation of methane avoidance systems

Our Supplier Compliance Criteria Neste Oil has a strict approach to Supplier Selection Neste Oil Sustainability Compliance Market (mandate) Neste Oil's National and Multi-stakeholder Sustainability International Requirement Policy initiatives Regulations Eg: RSPO No-Deforestation eg: ISPO, ILO Eg: RFS US EPA, Guideline EU-RED

RSPO=Roundtable For Sustainable Palm Oil
ISPO = Indonesian Sustainable Palm Oil System
ILO = International Labour Organization
RFS US EPA = Renewable Fuel Standard as issued by United States Environmental Protection Agency

Sustainability and Public Affairs/Adrian Suharto

Why does it matter?

Reporting Requirements

 Companies are required to report on their social practices to the regulators and stakeholders

Eg. Finnish law and Singapore agency requires government companies to report on their social commitments

Consumer and Market Perception

- NGO campaigns pressure consumer to adapt more responsible attitude in choosing products
- Brands are campaigned against openly

Eg: Traceability of products are now

27.10.2014

Biofuels Regulations

 Public consultation processes in drafting related regulations enables

Eg. EU RED have been considering to include Social criteria, NGOs have been giving their input

Global Commitments and Trends

 Countries have committed to more responsible practices and targets for sustainable practices (climate change and social issues). This has also lead companies to join in the commitments

Eg: Indonesia committed to GHG reductions, Neste Oil signed the UN global compact

13

Summary

- Biofuels market is a highly regulated market
- RSPO-RED is a simple upgrade to RSPO offering opportunities to the EU market
- Neste Oil prefers supply which fulfil our policies and principles
